and Telecommunications Board, Commission on Physical Sciences, Mathematics, and Applications, NII 2000 Steering Committee, 1998-03-05 This book contains a key component of the NII 2000 project of the Computer Science and Telecommunications Board, a set of white papers that contributed to and complements the project's final report, *The Unpredictable Certainty: Information Infrastructure Through 2000*, which was published in the spring of 1996. That report was disseminated widely and was well received by its sponsors and a variety of audiences in government, industry, and academia. Constraints on staff time and availability delayed the publication of these white papers, which offer details on a number of issues and positions relating to the deployment of information infrastructure.

Bounded Thinking Adam Morton, 2012-11-08 *Bounded Thinking* offers a new account of the virtues of limitation management: intellectual virtues of adapting to the fact that we cannot solve many problems that we can easily describe. Adam Morton argues that we do give one another guidance on managing our limitations, but that this has to be in terms of virtues and not of rules, and in terms of success—knowledge and accomplishment—rather than rationality. He establishes a taxonomy of intellectual virtues, which includes 'paradoxical virtues' that sound like vices, such as the virtue of ignoring evidence and the virtue of not thinking too hard. There are also virtues of not planning ahead, in that some forms of such planning require present knowledge of one's future knowledge that is arguably impossible. A person's best response to many problems depends not on the most rationally promising solution to solving them but on the most likely route to success given the profile of intellectual virtues that the person has and lacks. Morton illustrates his argument with discussions of several paradoxes and conundra. He closes the book with a discussion of intelligence and rationality, and argues that both have very limited usefulness in the evaluation of who will make progress on which problems.

Computational Intelligence. Theory and Applications Bernd Reusch, 2003-06-30 Ten years of „Fuzzy Days“ in Dortmund! What started as a relatively small workshop in 1991 has now become one of the best known smaller conferences on Computational Intelligence in the world. In fact, it was (to my best knowledge) the first conference to use this term, in 1994, although I confess that another, larger conference was announced first and the trade mark “Computational Intelligence” was not coined in Dortmund. I believe, that the success of this conference is grounded on the quality of its reviewed and invited papers as well as its good organization. From the beginning, we have sent every paper anonymously to referees, and we have always accepted only around 50% of the papers sent in. This year it was a little less than that. I would like to thank everybody who helped us by considering Dortmund's Fuzzy Days as the conference at which to appear. I know that among the abstracts not accepted there were some quite good ones, but we were restricted to a fixed number. I also know that referees do a good job but cannot always judge wisely from abstracts. Hence my apologies to those who did not make it this year. Please try again! I would like to point out that our conference also has a good regional reputation. I am grateful to the City of Dortmund, its Lord Mayor Dr. Langemeyer, the Dortmund project, the DFG - Deutsche Forschungsgemeinschaft, the KVR - Kommunalverband Ruhrgebiet, the Martin-Schmeißer-Stiftung, and the C-line AG/Quantum GmbH for their valuable support.

Collected Works (volume 1): Published Papers STEPHEN LUTTRELL,2023-10-24 The motivation for the research that is described in these volumes is the wish to explain things in terms of their underlying causes, rather than merely being satisfied with phenomenological descriptions. When this reductionist approach is applied to information processing it allows the internal structure of information to be analysed, so information processing algorithms can then be derived from first principles. One of the simplest examples of this approach is the diagonalisation of a data covariance matrix – there are many variants of this basic approach, such as singular value decomposition – in which the assumed independent components of high-dimensional data are identified and extracted. The main limitation of this type of information analysis approach is that it is based on linear algebra applied globally to the data space, so it is unable to preserve information about any local data structure in the data space. For instance, if the data lives on a low-dimensional curved manifold embedded in the data space, then only the global properties of this manifold would be preserved by global linear algebra methods. In practice, data whose high-dimensional structure is non-trivial typically lives on a noisy version of a curved manifold, so techniques for analysing such data must automatically handle this type of structure. For instance, a blurred image of a point source is described by its underlying degrees of freedom – i.e. the position of the source – and as the source moves about it generates a curved manifold that lives in the high-dimensional space of pixel values of the sampled image. The basic problem is then to deduce the internal properties of this manifold by analysing examples of such images. A more challenging problem would be to extend this analysis to images that contain several overlapping blurred images of point sources, and so on. There is no limit to the complexity of the types of high-dimensional data that one might want to analyse. These methods then need to be automated so that they do not rely on human intervention, which would then allow them to be inserted as “components” into information processing networks. The purpose of the research that is described in these volumes is to develop principled information processing methods that can be used for such analysis. Self-organising information processing networks arise naturally in this context, in which ways of cutting up the original manifold into simpler pieces emerge automatically.

Capital Punishment in Twentieth-Century Britain Lizzie Seal, 2014-03-05
Capital punishment for murder was abolished in Britain in 1965. At this time, the way people in Britain perceived and understood the death penalty had changed – it was an issue that had become increasingly controversial, high-profile and fraught with emotion. In order to understand why this was, it is necessary to examine how ordinary people learned about and experienced capital punishment. Drawing on primary research, this book explores the cultural life of the death penalty in Britain in the twentieth century, including an exploration of the role of the popular press and a discussion of portrayals of the death penalty in plays, novels and films. Popular protest against capital punishment and public responses to and understandings of capital cases are also discussed, particularly in relation to conceptualisations of justice. Miscarriages of justice were significant to capital punishment's increasingly fraught nature in the mid twentieth-century and the book analyses the unsettling power of two such high profile miscarriages of justice. The final chapters consider the continuing relevance of capital punishment in Britain after abolition, including its symbolism and how people negotiate memories of the death penalty. *Capital Punishment in Twentieth-Century Britain* is groundbreaking in its attention to the death penalty and the effect it had on everyday life and it is the only text on this era to place public and popular discourses about, and reactions to, capital punishment at the centre of the analysis. Interdisciplinary in focus and methodology, it will appeal to historians, criminologists, sociologists and socio-legal scholars.
